## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

3. Claims 12-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lin (U.S. 5,965,759) in view of Yoder *et al.* (*Organometallics*, 1998).

Lin discloses methods for isomerization of a meso isomer of a metallocene such as  $\text{Me}_2\text{Si}(2\text{-Me-4-PhInd})\text{ZrCl}_2$  to its racemic isomer in the presence of a group I or group II halide (see examples). The reference does not disclose use of salts having formula  $[\text{R}_4\text{W}]\text{X}$ , as recited in the instant claims. Yoder *et al.* discloses use of tetra-*n*-heptylammonium chloride as a metallocene isomerization agent (Table 3). One having skill in the art would recognize the advantage that isomerizations may be carried out in aprotic nonpolar solvents such as toluene, and that reactions are carried out in homogeneous solution, thereby obviating the need to filter the product, as would be required using salts in Lin's process. The combination of references would have suggested to one having ordinary skill in the art that tetra-*n*-heptylammonium chloride is a useful isomerization agent for use where toluene is required as solvent or where

separation of salts in an extra step is not desired. Thus, it would have been obvious to one having ordinary skill in the art to modify Lin's process using the quaternary ammonium salt disclosed in Yoder *et al.*, and one having ordinary skill in the art would have expected such an embodiment to work.
